Introduction

Thank you for your interest for our MDR services. With this guideline we have tried to provide guidelines for MDR assessments however if you still have specific questions for which are not covered in this guidance you may reach us via <u>mdsales@maltaca.com</u>

Where To Find Guidance Documents

EU Commission publishes many useful guidance which will help manufacturers to use during the conformity assessment processes. Please check following website to see published guidance documents.

https://health.ec.europa.eu/medical-devices-sector/new-regulations/guidance-mdcg-endorsed-documents-and-other-guidance_en

Decision To Make Before Applying

There are several decisions to be made for a manufacturer before applying to MCA. In this part we will try to identify guidelines for these decisions.

Who Can Apply?

Manufacturers may apply for conformity assessment services and the application documents shall be submitted directly by them however if the manufacturer is not located in EU Union, the EU Authorized Representative may submit applications on behalf of the manufacturer.

When To Apply?

Conformity assessment process starts after a product finishes it's pre-clinical and clinical lifecycle and finishes before a product is made available on the market. Therefore, a manufacturer should have been finished all pre-clinical and clinical verifications and validations for the subject product before applying to a Notified Body. This includes finishing all necessary process validations in the manufacturing site.

Certain exceptions apply during the transition period between according to article 120 of MDR in which the manufacturer may submit a plan for final submission of missing technical documentation and MCA shall evaluate this plan. If MCA accepts this plan, the agreement will be initiated based on a condition to fulfill the deadline for submitting missing documentation.

Is The Device a Medical Device?

MDR applies to medical devices. The manufacturers shall make it sure that their device is a medical device according to MDR. To check the definition of the medical device please consult MDR Article 2. Borderline manual and MDCG 2020-5 will also provide guideline for deciding whether a device is a medical device or not.

Product Class

The obligations of the manufacturer and MCA as a Notified Body changes according to the product class. Deciding on the product class is one of the most important decisions to be made by the manufacturer. The product classes are as follows,

- class Is/Im/Ir
- class IIa
- class IIb

- Class III

The manufacturer shall use classification rules to define the product class. Detail explanation about classification is provided in MDR Annex VIII. For more guidance documents please refer MDCG 2021-14, Borderline manual and MDCG 2020-5.

EMDN

EMDN stands for European Medical Device Nomenclature. For every product the manufacturer shall assign one EMDN code. EMDN code is free and publicly available in following EU Commission website <u>https://webgate.ec.europa.eu/dyna2/emdn/</u> The manufacturer shall state this code both in application forms and in their technical documentation. For more information please read MDCG documents published in following website <u>https://health.ec.europa.eu/medical-devices-sector/new-</u> regulations/guidance-mdcg-endorsed-documents-and-other-guidance_en

EUDAMED REGISTRATION

EUDAMED stands for European database on medical devices. This database will be used to regulate many new requirements of MDR. The manufacturers shall register themselves as an actor to EUDAMED and obtain SRN number. This number will be used by the MCA to identify the manufacturer. Additionally, all products shall be registered to EUDAMED together with their Basic UDI-DI code. The Basic UDI-DI will also be printed on the certificates. MCA will register information of certificates through EUDAMED. EUDAMED will have extending usage in MDR ecosystem. Until EUDAMED is fully functional the EU Commission has published MDCG 2021-1 Rev.1 to state possible alternatives.

CONFORMITY ASSESSMENT PROCEDURES

A conformity assessment process carried out by the manufacturer of demonstrating whether specified requirements relating to a product have been fulfilled. There are several types of conformity assessment procedures as described in article 52 of MDR. A product is subjected to conformity assessment both during the design and production phase. In some cases, these phases can be covered by a single procedure and in some cases can be covered by different types of procedures. The procedures are divided into two main groups, these are Procedures based on type (EU-type examination) and procedures based on quality assessment. The manufacturer shall select a procedure to apply based on its own decision.

MCA's notification covers following quality assessment-based procedures,

- Annex IX Chapter I and III (EU Quality Management System). In this procedure MCA will focus on implementation of complete QMS(full quality) of the manufacturer to verify the system is capable of securing MDR requirements and ensuring safe and effective products are made available on the market.

- Annex IX Chapter II (EU Technical Documentation Assessment). In this procedure MCA will review technical documentation to verify the product contains necessary amount of objective evidence for complying with MDR requirement and whether they are safe and effective.

- Annex XI Part-A (EU Quality Assurance). In this procedure MCA will verify implementation of QMS of the manufacturer mainly by focusing on production part. Including manufacturing controls, quality controls, release controls etc. However it shall be noted that for MCA this does not mean that the manufacturer may exclude design phase from its QMS.

For different product class, different variants of the conformity assessment procedures apply. Below section will provide a summary on them by mentioning only applicable ones for MCA.

PROCEDURES FOR CLASS IS/IM/IR

For these devices following options are applicable,

For both options still the manufacturer will need to prepare a technical documentation according to Annex II and III of MDR however MCA will not systematically review them as a "technical documentation assessment". The review and verifications will focus on sterility for class Is devices, metrology for class Im devices and re-use aspects for class Ir devices.

⁻ Option 1: Annex IX Chapter I and III

⁻ Option 2: Annex XI Part-A

Class Is/Im/Ir	Initial	Surveillance	Surveillance	Surveillance	Surveillance	Re-
	Assessment	1	2	3	4	Certification

SSCP Verification	N/A	N/A	N/A	N/A	N/A	N/A

PROCEDURES FOR CLASS IIA NON-IMPLANTABLE DEVICES

For these devices following options are applicable,

- Option 1: Annex IX Chapter I and III

- Option 2: Annex XI Part-A

For both options still the manufacturer will need to prepare a technical documentation according to Annex II and III of MDR and MCA will systematically review them as a "technical documentation assessment" per device category.

Class IIa Non Implantable	Initial Assessment	Surveillance 1	Surveillance 2	Surveillance 3	Surveillance 4	Re- Certification

Follow-Up Report	Follow-Up Re	ports at least anr	nually.			
Assessment						
PSUR Assessment	Yes, manufac	turer shall updat	e PSUR when nec	essary and at lea	st every two year	rs. Updates will
	be followed a	nd assessed thro	ugh EUDAMED.			
SSCP Verification	Yes, manufac	turer shall updat	e SSCP at least an	nually "if indicate	ed." MCA will ve	rify initial
	version and t	he updates and u	pload to EUDAM	ED.		

PROCEDURES FOR CLASS IIB REGULAR DEVICES

These devices include regular class IIb devices which are non-implantable, non-implantable wet devices and non-rule 12 Active Devices. For these devices based on MCA's notification scope there is only one available option which is Annex IX Chapter I and III.

Class IIb Regular	Initial Assessment	Surveillance 1	Surveillance 2	Surveillance 3	Surveillance 4	Re- Certification
QMS Audit	Yes	Yes	Yes	Yes	Yes	Yes
Technical Documentation	Sampled	Continuing Sam	pling			
Assessment	per Generic

	through EUDAMED.					
SSCP Verification	Yes, manufacturer shall update SSCP at least annually "if indicated." MCA will verify initial					
	version and t	version and the updates and upload to EUDAMED.				

REQUESTING OFFERS(PRE-APPLICATION)

When manufacturers want to receive an offer from MCA, they shall fill in MCA FR.MED.174 Pre-Application Form and MCA FR.MED.01 Annex-3, together with the requested documents in this form. Any type of communication shall be directly in between the MCA and the manufacturer or manufacturer's EU Authorized Representative. Consultancy companies, subcontracted individuals, MCA contact offices cannot submit pre-applications alone on behalf of the manufacturer. The manufacturers shall give special importance for using their official e-mails under their company domain as well as shall provide attention that the corresponding responses are coming from an e mail under maltaca.com domain. The filled in form and supporting documents shall be sent to mdsales@maltaca.com

Together with the above-mentioned pre-application form, the manufacturer shall provide user manuals or different type of supporting documentation providing details for the applied products. However detailed information may be requested for further evaluation.

In this phase MCA will try to get an overview of the manufacturer and it's products in order to estimate pricing.

All the currently used man/day fees and fixed price items will be publicly available in www.maltaca.com

It is important to know that MCA's prices will mainly depend on the time to be used for the assessment and this may vary when detailed review of the application is performed.

If the result of the initial control is positive MCA will provide an offer based on the estimated prices. If the manufacturer wants to accept the offer then the official application stage starts.

SUBMITTING APPLICATIONS

Once the offer is accepted, MCA will set up a team to perform a detailed application review. At this point the manufacturer shall fill in FR.MED.01 Application forms and its annexes and submit necessary documentation. An application review will be performed by MCA to do certain verifications, perform a completeness check, plan resources, and create plans to cover a certification cycle. If found acceptable MCA will draft a contract. Once the contract is signed by both parties the conformity assessment activities will start.

During the completeness check MCA may report some missing and incomplete documents. The manufacturer shall submit missing and incomplete documents within agreed deadline.

Application review will also include a sampling plan for the technical documentation and assessment program for the whole certification cycle. These documents will be shared with the manufacturer.

Refusal of the application by MCA and withdrawal of the application by the manufacturer will be reported through EUDAMED.

How Fees Are Calculated

Mainly the fees can be categorized in two main parts. Fixed fees and fees based on duration. Application fee and annual certificate usage fee have fixed prices based on product risk class. Audit and technical documentation review fees have man/day fees. For more detail please consult to MCA FR.MED.165 List of Standard Fees published in <u>www.maltaca.com</u>

Special Considerations In Contracts

It is important for a manufacturer to know that contracts mainly show pre-calculated fees. The resources to be used for conformity assessment tasks may change due to changing situations of the manufacturer or findings of the assessment. MCA will invoice the manufacturer based on the finally resources used and this may differ from the contract resulting either a lower or higher amount to be invoiced.

Additionally, the contract also mentions rates for travel fees or fees during the change assessments which can only be calculated if used and during the performance of the tasks.

MCA will also invoice manufacturer's for reoccurring non-conformity response controls, time used for assessing appeals, time used for analyzing changes, time used to follow up expert panel opinions and for other possible used resources.

FR.MED.63 is the general terms which is a permanent annex for the contract. These terms generally set basic rules for conformity assessment tasks. These terms will always be available in the website and the manufacturer shall keep track of the changes on these terms.

Language Requirements

MCA accepts English for corresponding and for the language of documents/records for submitted documents.

The complete technical file content shall be in English. If especially third-party test reports are originally in other Languages, these shall be translated by a legally approved translation service provider. Please beware that a document which is not provided in English may be deemed as not existing therefore may lead to negative results.

The language of the QMS system securing compliance to MDR requirements shall be in English. These may include quality manuals, procedures, instructions, and records. The manufacturer may use some lower level of instructions in different language however this may require a translator to participate in audits.

Technical Documentation File Format

The files shall be in pdf format. The files shall be searchable. Titles and the locations of the documents shall be carefully and clearly organized and shall allow proper navigation and understanding. If not signed by legal electronic signatures(a valid electronic signature certificate appearing in the documents) the documents shall be signed by hand and the pages where these signatures exists shall be added to the searchable version of the documents. The files shall not be locked or protected.

TECHNICAL DOCUMENTATION CONTENT

The technical documentation content shall comply with MDR Annex II and III. In this part you may find a basic list of required documentation and certain guidelines. Please remember that each device require specific concern to cover in order to show compliance to the MDR therefore this list and guidelines can not be taken as an exhaustive and complete list for every device.

	Tissues of Animal Origin, Medicinal Products, and substances that are

	systematically absorbed. Where the device does not contain such substances, a declaration shall be provided for their non-presence.)
Identification of Hazardous Chemical Substances	(The manufacturer shall Hazardous Chemical Substances. Where the device does not contain such substances, a declaration shall be provided for their non-presence.)
Technical specifications, such as features, dimensions, and performance attributes, of the device and any variants/configurations and accessories that would typically appear in the product specification made available to the user, for example in brochures, catalogues and similar publications	(shall be provided as tables and shall allow matching each variant together with critical specifications, accessories, configurations, features) (the claimed specifications shall have proof documents provided in design related parts of the technical documentation.
Overview of the previous generation or generations	History of the device shall be clearly defined by outlining the differences between generations.
Market History of the Device	Please indicate the device is/was available in which markets since when together with the number of sold items. Please indicate current/previous device licences and certificates if there is any.
Overview of identified similar devices available on the Union or international markets	

Section 2 Information To Be Supplied By The Manufacturer

Content	Guidance
	[]shows possible documents to provide
Complete set of Labels and Markings	[Label] [Markings] [Packaging Information] [Labelling instructions] Provide main label, sub labels, marking on the device, packaging label, information and illustrations on the label and packaging. The labels shall be lay out of actual labels. The labels or supporting documents shall provide information about dimensions, colour coding if used, position of the label and other relevant information
IFU, Implant Card and other relevant informative documents	[IFU] [Implant Card] [Service Manual] [Surgical Technique] IFU shall use a language for lay person. IFU shall contain consistent information about product description, product name, intended use, indications, contraindications, warnings etc. The warnings provided in the IFU shall be provided in a traceable way to Risk Analysis and shall not be provided as plain text. The manufacturer shall include other types of informative documents such as service manual, surgical technique etc. The documents shall be ready to publish lay outs. If electronic IFU's are used, these shall comply with relevant regulations and the documentation shall contain necessary explanations for reaching the documents.

Section 3 Design and Manufacturing Information

Content	Guidance
Information on design stages applied to the device	Provide information on which kind of activities are performed in each design stage preferably through a table by referring activities, plans, protocols, inputs, outputs. Documents proving internal and external reports/validation/verifications shall be referred.
Design History	Provide information, preferably through a table, on major design changes which are previously approved or waiting to be assed. The information shall clearly outline major design changes for previously MDD certified devices when they are in transition to MDR.
Manufacturing Flow	Provide an illustrative demonstration of manufacturing steps which in sequence describes activities starting from incoming inspection to release.
Information and specifications, including the	[Process tables] [Process Validation Master Plans]

activities are performed	
List of Critical Suppliers / Subcontractors	Provide a list of critical suppliers by mentioning the activities they perform, the goods/services they provide. Justify why they are selected as critical.
Critical Supplier Agreements	Provide critical supplier agreement which secure compliance to MDR including unannounced site audits to critical suppliers.

Section 4 General Safety and Performance Requirements

Content	Guidance
	[]shows possible documents to provide
	[]shows possible documents to provide

General safety and performance requirements	[GSPR Checklist] Include a checklist provides following items as a table, - Requirement of MDR - Statement whether the requirement is applicable or not. - Justification in case a requirement is selected as non-applicable - Reference to Common Specifications, Harmonized Standards or other relevant solutions including a reference to their version. - method or methods used to demonstrate conformity with each applicable - Cross reference to controlled documents and precise reference to the location in the technical document - Unique summary of applied methods, major validation and verification outcomes.	
Essential requirements for Machinery Directive	<i>If your device is also a machinery according to 2006/42/EC, please provide a checklist to demonstrate compliance to machinery directive.</i>	

Section 5 Benefit-Risk Analysis and Risk Management

Guidance	e
[]shows	possible documents to provide
Risk Management Documentation Risk Management Documentation [Risk Ma [Risk Ma] [Risk Ma [Risk Ma [Risk Ma [Risk Ma [Risk Ma] [Risk Ma [Risk Ma [Risk Ma] [Risk Ma] [Risk Ma [Risk Ma] [Risk Ma [Risk Ma] [Risk Ma	nagement Procedure] nagement Plan] nagement Team][Supporting evidence for competency of nanagement team] ilysis] nagement Report] umentation shall mainly consist of above listed items. The cturer shall indicate whether EN 14971 is applied or not. If ied justification of the superiority of the selected methods be provided. methods need to identify gradings for risk levels in terms of ity and severity. Each individual risk shall be downgraded as ossible by applying state of art risk control methods even he risk is low before applying any risk control method. The counter effects of applied risk control measures need to be d. The manufacturer shall provide risk-benefit assessment individual risks as well as an overall risk-benefit assessment. ufacturer shall provide a residual risk assessment for each al risk as well as an overall residual risk assessment. by for the design risks the risk control measures shall first k control by design. ufacturer shall provide risk analysis for design, cturing, post market related risks and each major part of the shall easily be identified and separated. ical sub category such as clinical risks, usability risks, urity risks, biocompatibility risks, process risks, software II be clearly identified. The whole risk management, g each individual risk shall have traceability information for ng relevant documents and QMS of the manufacturer.

Section 6 Product Verification and Validation

Section 6A Pre-Clinical Verification and Validation

In general, if a type is selected for testing, proper evidence shall be provided whether the worst-case scenario is covered. Where testing provided ISO 17025 accreditation certificate and scope of the laboratory shall be provided.(valid at the time of the testing)

Content	Guidance
	[]shows possible documents to provide
Pre-Clinical Literature Evaluation	Include a literature evaluation within a systematic approach to
	identify pre-clinical data that is applicable for the device. The pre-
	clinical literature evaluation needs to be updated periodically.
	Scientifically justify the ability to use data. The manufacturer may
	also decide to separate pre-clinical literature evaluation for below
	specific topics.
Benchmarking Studies and Tests	
Validations and Justifications for Expected Lifetime	
Justification for transability of existing test	Where no new testing has been undertaken, the documentation shall
evidence	incorporate a rationale for that decision. An example of such a
	rationale would be that biocompatibility testing on identical
	materials was conducted when those materials were incorporated in
	a previous version of the device that has been legally placed on the
	market or put into service;
Key Design Verifications	Provide results of key design verifications applied for devices
	especially for class IIb implantable and class III devices. Identify
	design inputs and outputs.
Biocompatibility of the device including the	[Biocompatibility Evaluation]

Section 6C Special Requirements For Devices Incorporating Materials to be Absorbed by or Locally Dispersed in The Human Body

Content	Guidance
content	[]shows possible documents to provide
Description of the materials intended to be	
absorbed by or locally dispersed in the human body	
Absorbed by of locally dispersed in the numan body	
Absorption, distribution, metabolism and	
excretion;	
Possible interactions of those substances, or of	
their products of metabolism in the numan body,	
with other devices, medicinal products or other	
substances, considering the target population, and	
its associated medical conditions;	
Local tolerance	
Toxicity, including single-dose toxicity, repeat-dose	
toxicity, genotoxicity, carcinogenicity and	
reproductive and developmental toxicity, as	
applicable depending on the level and nature of	
exposure to the device.	
Toxicity, including single-dose toxicity, repeat-dose	
toxicity, genotoxicity, carcinogenicity and	
reproductive and developmental toxicity, as	
applicable depending on the level and nature of	
exposure to the device.	
In the absence of above studies, a justification shall	
be provided	
The label shall bear all of the following particulars;	
the overall qualitative composition of the device	
and quantitative information on the main	
constituent or constituents responsible for	
achieving the principal intended action	
The instructions for use shall contain all of the	
following particulars;	
warnings and precautions, where appropriate,	
related to the general profile of interaction of the	
device and its products of metabolism with other	
devices, medicinal products and other substances	
as well as contraindications, undesirable side-	
effects and risks relating to overdose;

Bioburden Testing	
Pyrogen testing	
Description and Suitability Of Sterilization Method	
Sterilization Validation Documentation	
Validation For Sterile Barrier Systems	
Testing For Sterilization Residuals	
Aseptic Filling Validation	

Section 6G Special Requirements For Devices To Be Connected or Combined With Other Devices

Content	Guidance
Description of the combinations and accessories	
Validation for compatibility with other devices	

Section 6H Clinical Data

Content	Guidance
	[]shows possible documents to provide
Clinical Evaluation Procedure	
Equivalent/Similar Devices	If clinical data from equivalent/similar devices to be used provide evidence for proving equivalance/similarity.
Clinical Evaluation Plan	
Clinical Evaluation Report Authors CV's and	
assessment of their conflict of interest	
Literature search protocol and report	
Appraisal Criteria	
List of selected and excluded articles including the	
reason for exclusion	
Full text of available clinical data	
Identification of other types of used clinical data	
Clinical Evaluation Report	

Clinical Investigation (including PMCF investigations)	Complete clinical documentation including - Clinical investigation plan - Clinical investigation report - Ethics committee approval(s) - Competent Authority approval(s) - Publications in scientific journals (if applicable)	
Transferability of Clinical Investigations performed outside EU	<i>Provide a justification for compliance and transferability of the data for EU Regulations and population.</i>	
Previous Clinical Consultations	Provide the result of the clinical consultation for class III implantable devices and class IIb Active Devices intended to administer and/or remove a medicinal product	
SSCP	Provide SSCP for class III devices and implantable devices	

Section 7 Post Market Surveillance Documentation

Content	Guidance
	[]shows possible documents to provide
Post Market System Procedures	
PMS Plan	
PMCF Plan/Protocol	
PMCF Report	
PSUR Report	
PMS Report for class I devices	
Procedures for Vigilance	
Summary of previous incidents and recalls	

Section 8 Declaration Of Conformity

Content	Guidance []shows possible documents to provide
Declaration of Conformity	Provide draft declaration of conformity

Section 9 Other Required Documentation

Content	Guidance []shows possible documents to provide
EU Representative Agreement	For manufacturers outside the Union

CONFORMITY ASSESSMENT TASKS

After signing the contract, the manufacturer shall provide all technical documentation and QMS documentation to MCA. Conformity assessment projects starts after initiating the contact and allocating resources. Conformity assessment tasks mainly consist of two main group of activities. These are audits and Technical Documentation Reviews. These two main group activities will be performed separately from each other.

Technical Documentation Pre-Review

Only during the initial application, MCA will perform a pre-review to technical documentation. The manufacturer shall provide brief explanation and document navigation by using FR.MED.80 form. MCA reviewers will use the same form to perform pre-review. At this stage the provided content is reviewed for their completeness and comprehensiveness. As a result of this review, MCA shall decide on continuation of the conformity tasks. If major issues are found, the manufacturer shall complete in maximum 6 months. If minor issues are reported these can be reviewed during the detailed technical documentation review. If the reported non-conformities are not properly corrected within defined timelines and conditions or if there are many major nonconformities found meaning that the device has not completed its pre-market lifecycle or meaning product safety and performance is not fully demonstrated, MCA will withdraw the application of the device in question. If findings are addressed properly MCA will continue with detailed technical documentation review. MCA will perform this review to the devices that are going to be reviewed initially and the manufacturer is responsible for reflecting necessary corrective actions if there are remaining technical documentation which is not yet sampled.

Stage 1 Audit

Only during the initial application, MCA will perform a stage 1 audit. This audit is an office audit. In this audit the preparedness of the manufacturer's QMS and readiness to the stage 2 QMS audit will be evaluated. The non-conformities reported during this audit shall be closed within maximum 4 months. The manufacturer shall provide corrections and corrective actions for each non-conformity reported during this audit however if MCA assessment team observes that all major non-conformities are downgraded to minor level, they may decide to check remaining issues during the stage 2 audit.

Detailed Technical Documentation Review

Detailed technical documentation reviews are part of initial and ongoing assessments. Especially where technical documentation is sampled, MCA will perform detailed technical documentation review during the surveillance and re-certification. At this stage the provided technical documentation will be reviewed by relevant product reviewer and/or clinical specialist deeply to verify the product complies with safety and performance requirements of MDR. All reported non-conformities, regardless from its classification, shall be effectively and completely closed within maximum 4 months.

Technical Documentation PMS and Change Review

If a technical documentation was subject to detailed review priorly, if the device falls into a category which sampling is not applicable or if there are too few devices in the same sampling category with this device, MCA will perform a limited technical documentation review focusing on PMS and changes during the ongoing assessments. All reported non-conformities, regardless from its classification, shall be effectively and completely closed within maximum 4 months.

Stage 2 Audit

During the initial application after stage 1 audit, MCA will perform stage 2 audit to verify effectiveness of QMS and suitability of technologies applied to the production of the device. Stage 2 audits are onsite audits. All reported non-conformities, regardless from its classification, shall be effectively and completely closed within maximum 4 months.

Surveillance Audit

Surveillance audits are onsite audits to verify applied QMS and production technologies continue to conform to the requirements of MDR. If all reported non-conformities are minor, the verification of the corrections and corrective actions will be checked by MCA during the next surveillance audit. If a major non-conformity exists, all reported non-conformities, regardless from its classification, shall be effectively and completely closed within maximum 4 months. The first surveillance audit shall be performed in maximum 12 months after the certification date. Other following routine surveillance audits shall be performed within maximum 12 months after the previous surveillance audit. Surveillance audits may be performed at a time earlier than 12-month periods if necessary. For class III products; surveillance assessments shall include tests in accordance with Annex IX Section 3.5 of (EU) 2017/745 Regulation. The scope of this testing shall include a test of the approved parts and/or materials. Additionally, if appropriate, a check that the quantities of produced or purchased parts and/or materials correspond to the quantities of finished devices shall be performed.

Re-certification Audit

Re-certification audits are onsite audits to verify applied QMS and production technologies continue to conform to the requirements of MDR. All reported non-conformities, regardless from its classification, shall be effectively and completely closed within maximum 4 months. Since surveillance assessments will require re-review of certain devices the manufacturer shall provide special attention to apply for re-certification which is proper enough to complete all necessary activities

Unannounced Audit

Unannounced audits are special onsite audits that are normally performed once in every 5 years however MCA may increase the frequency based on certain parameters. Unannounced audits include testing relevant devices. If all reported non-conformities are minor, the verification of the corrections and corrective actions will be checked by MCA during the next surveillance audit. If a major non-conformity exists, all reported non-conformities, regardless from its classification, shall be effectively and completely closed within maximum 4 months.

Response To The Non-Conformities

Even though there are maximum available deadline limitations for each type of conformity assessment task, the MCA assessment team may enforce limitations for deadlines especially due to the criticality of the non-conformity.

Except for application review completeness check, technical documentation pre-review and clinical evaluation findings the client shall fill in FR.MED.53 form as a CAPA plan.

It is very important for a manufacturer to realize that CAPA plan will be a tool for the MCA assessment team to verify all actions to be initiated therefore which may allow complete resolution for the non-conformity. For this reason,

- CAPA plan shall be a result of several meetings, impact analysis, gap analysis performed after receiving the finding report.

- CAPA plan shall list all details of the activities to be performed within a sequence.

- CAPA plan shall document the actual changes to be provided in documents by mentioning section/page and other relevant information.

- CAPA plan shall not be oriented solely to the reported subject but all necessary effected activities shall be planned to solve root reason.

If the CAPA plan is prepared very generally, by providing policy or declaration level claims, this can cause failure.

General Considerations

- The manufacturer shall take possible workload of MCA for planning activities which comes with a specific deadline.

- The audits include suppliers audits.

- Besides from routine conformity assessment tasks, MCA may raise non-conformities to the Manufacturer as a result of decisionmaking phase, internal control or as a result of external audits.

- MCA may take samples from the market for testing.

APPEALS ON CERTIFICATION DECISIONS

Manufacturer has right to appeal on the certification decisions taken by MCA. Once the appeal is received MCA will check whether if it is related with a certification decision of MCA or not within 7 days and inform the appeal holder. If accepted, MCA will set up a committee to evaluate the appeal and this committee will provide the recommended decision to the certification committee within 14 days. The certification committee then will provide final decision and inform the appeal holder accordingly.
